

No page is rendered as sent

Every document is pulled apart into blocks and laid back out in the browser's own language. The site supplies content and structure; the browser supplies the layout, always the same one.

AS THE SITE SENDS IT

41 elements, 6 of them the reason you came.

EVERY ELEMENT GETS A BLOCK

Heading

Text, at a fixed measure

Image or video

Table

List or steps

Quote or code

Form or control

Links out

Comments, folded

Aside or footnote

Anything that classifies as chrome, promotion or tracking gets no block, and is listed instead.

Ten block types cover the whole web you actually read.

AS YOU READ IT

LIST

LINKS OUT

Comments, 112 — folded until you ask

One column, one measure, one rhythm. The site's own CSS never reaches the screen.

Structure is kept, decoration is not
Reading order, headings, tables and captions survive intact. Brand type, colour and spacing do not.

Nothing is silently deleted
Dropped elements are counted and listed on every page, one click from being shown.

Escape hatch, per site
Pages that only work as built — a map, a web app, a checkout — render raw, and say so in the tab.

blocks land in reading order, top first

THIS VISIT

380ms to first block

The filter runs once, on the way in. You see blocks settle rather than a page repaint.

NEXT VISIT

0ms — served from the block cache

The block layout is kept per URL. Reopening the page is instant, and a background check quietly refetches if the source moved.

CACHE

2,418 pages held as blocks

Searchable offline, text and tables

Nothing cached from a logged-in page

Why not render, then reflow?

Because you would see the site's design first, then watch it get taken apart. The filter sits in front of paint, so the site's layout is never shown at all.

Ironbark structural specs

— already open in tab 3

*

Press **Tab** to hand this line to Claude instead of loading it

Structural pine is cheapest per metre, but not per metre of usable 200mm face.

Tab 2 lists 240 × 45 pine at a shelf price that works out lowest per linear metre. Tab 3 quotes ironbark at roughly two and a half times that, but its specs allow a 200mm board at 30mm rather than 45mm, so the price per usable board metre closes to about 1.6 times. Neither page states dressed dimensions, so the comparison assumes nominal sizes.

•

22 blocks in, 9 kept, laid out by Claude

bunnings

ironbark

disagree

HEADING

•

WRITTEN FOR THE PAIR

Pine or ironbark for a 200mm board

TABLE

•

TWO PRICE TABLES, MATCHED ON BOARD SIZE

BOARD	PINE, PER M	IRONBARK, PER M	USABLE AT 200MM
240 × 45	[YOUR PRICE]	[YOUR PRICE]	Yes, both
240 × 30	not listed	[YOUR PRICE]	One page only
290 × 45	[YOUR PRICE]	special order	Yes, with waste

CONFLICT

The supplier allows a 200mm face at 30mm; the retailer's grade notes assume 45mm. Both cite the same standard, one at an older revision.

ASIDE • YOUR OTHER TAB

Resaw capacity 200mm, so a 240mm board is ripped first either way.

THIS PAGE

Claude chose this layout on drop, from what the blocks were. It lives only in this browser and rebuilds from its sources when you open the tab.

put the two price tables side by side and drop the durability notes

RELAYING OUT

HEADING • UNCHANGED

Timber for the camera rig

● TABLE • MOVING LEFT

● TABLE • MOVING RIGHT

● TEXT • DURABILITY NOTES — LEAVING

● CONFLICT • KEPT

One source allows a 200mm face at 30mm, the other assumes 45mm. Blocks that disagree are never merged away, whatever the layout.

● ASIDE • FROM THE JIG PAGE

Resaw capacity is 200mm, so a 240mm board gets ripped first either way.

- WHAT YOUR SENTENCE CHANGED
- 2 tables moved into a two-column row
 - 1 text block dropped, kept in the index
 - Nothing refetched — all three sources are cached

Tabs are the unit you compose with

TAB STATES

Ordinary tab	One page, as the site sent it
Active, rules applied	Clay edge means the page was reformatted
Lifted, in your hand	Tilts and lifts off the strip
Drop target MERGE	Sage ring means release composes
Composed of two	Stacked marks, one per source
Composed of three stale	Stale when a source changed underneath

WHERE YOU DROP DECIDES WHAT HAPPENS

Between tabs — a clay seam. Release reorders, nothing is read.

Onto a tab — a sage ring. Release composes one page from both and puts it where the target was.

Onto a composed tab — it joins that page as another source. Four pages is the ceiling; a fifth has to replace one.

Rules that keep it trustworthy

No dialog on drop. Claude reads the blocks, picks a layout and builds it, and you correct it in the bar afterwards.

Sources are never thrown away. Split back returns the original tabs, untouched.

Every block on a composed page carries the mark of the page it came from.

Blocks that contradict each other are kept side by side, never averaged into one claim.

Nothing is composed from a page behind a login unless you say so once per site.

Four slots, shown in the strip while you drag. Past four the layout stops being readable, so the cap is a design decision rather than a limit of the model.

Cmd Z undoes a composition whole · /layout in the bar reshapes it in words
